NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docg/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 72 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                             ö
                                                   PCR primers AA226647-48 were used to amplify the antisense cDNA sequence of human tumour rejection antigen RUR-1. The RUR-1 antisense sequence is the antisense strand of a ubiquitously expressed gene. The antisense strand codes for a polypeptide which is preferentially expressed in tumour samples and tumour-derived cells lines. The polypeptide is unrelated to any TRAP protein. The sequence was isolated from a renal cell carcinoma line LB9211-RCC. The RUR-1 nucleic acids and polypeptides can be used for diagnosis, prognosis or treatment of a disorder characterized by the expression of a RUR-1 antisense cDNA molecule or an expression product, such as cancers, e.g. renal cell carcinoma, colorectal carcinoma, melanoma, sarcoma or leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /*tag= c

The present sequence represents the antisense cDNA sequence of human tumour rejection antigen RUR-1. The present sequence is the antisense strand of a ubiquitously expressed gene. The antisense strand codes for a polypeptide which is preferentially expressed in tumour samples and tumour-derived cells lines. The polypeptide is unrelated to any TRAP protein. The sequence was isolated from a renal cell carcinoma line IB9211-RCC. The RUR-1 nucleic acids and polypeptides can be used for diagnosis, prognosis or treatment of a disorder characterized by the expression of a RUR-1 antisense cDNA molecule or an expression product, such as cancers, e.g. renal calcinoma, colorectal carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /product= NSI_(residues_1..29)

This sequence encodes a novel plasmid construct, SV-PEwt which is used in a method for the production of a vaccine against flavivirus infections. The construct comprises nucleic acid encoding flavivirus proteins E and prw/M in full-length native form. The vaccine is used especially for vaccination against tick-borne encephalitis (TBE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New DNA and RNA mols encoding proteins of meningoencephalitis virus -
useful in vaccines, diagnostic agents and detection probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Encodes Western subtype of early summer meningoencephalitis (ESME).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Encodes all the structural proteins of ESME virus. The invention covers fragments of this sequence and analogous RNA molecules. Corresponding mRNA sequence given in specification.
                                                                                                                                                                                DB 19; Length 2181;

                                                                                                                                                        parts of the TBE virus sequence coding for proteins E and prM+M were amplified using PCR. Sequence analysis of the amplified fragments showed that most contained mutations. One clone which encoded full-length pratein E in their wild-type forms. The combined coding insert was incorporated into commercially available vector pSybeta from which the beta-galactosidase gene and part of the polylinker had been removed. The resulting construct was designated pSy-PEW and was sultable for liposome-mediated transfection of COS-1 cells. The cells were cultured to produce subviral particles for use in a vaccine to protect mice against TBE virus infection. The present sequence is that of the TBE-derived insert of plasmid pSy-PEWt.

                                         encoding tick borne encephalitis virus RNA - useful for vaccine
                                                                                                                                       The infectious TBEV nucleic acid can be modified to trigger prodn. of attenuated TBEV which can be used to produce a vaccine. The DNA pref. has at least one modification that reduces virulence and/or affects replication, esp. an additional G ahead of position 1, a modification at the prM cleavage site, a modification at a N-glycosylation site, one of a large number of point mutations of the TBEV E protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          /*note= "nucleotide illegible in the specification"

```
fertility defect in a male, comprises detecting the presence of a con-phosphorylated tyrosine residue in the kinase insert region of a con-phosphorylated tyrosine residue in the kinase insert region of a kit/Stem cell factor receptor (SCF-R) (designated as Kit/SCF-R or Kit), or a mutation in the nucleic acid or polynuclectide encoding the CKIT/SCF-R. The presence of such mutation or non-phosphorylation indicates a fertility defects in males. The Kit inhibiting agents are suitable as for incorporation into pharmaceuticals to treat subjects in need of spermatogenesis inhibiting germ cell proliferation during cancer therapy. The Kit enhancing agents may be used to promote spermatogenesis to chance fertility in males suffering from a Kit-mediated fertility defect. The genetically altered mice are useful models for sterility testing in a mammal. The present sequence is a cDNA encoding mutine kinase insert region of Kit/SCF-R.

These particles may be use in vaccines (live attenuated or inactivated), opt. formulated with an immunomodulator. These virus particles are also useful as seed for viral replication. The new cDNA is also useful itself as a vaccine.

The sequence is the first complete TBEV sequence known and makes possible targeted alteration of the viral genome (partic. for attenuation or increasing viral yields).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Complete DNA encoding tick borne encephalitis virus RNA - able to produce infectious viral particles for use in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 79.2%; Score 19.8; DB 17; Length 11141; Best Local Similarity 91.3%; Pred. The sequence is used in a DNA vaccine to protect against viral tick-borne encephalitis. The vaccines induce cross-protection (humoral, cell-mediated or mucosal) against both Russian spring summer and Central European encephalitis viruses.

AAC64754 represents the RRV genome sequence, and AAB53123 to AAB53204 represent the proteins encoded by the genome sequence. The present invention also specifically claims the individual open reading frame (ORF) nucleotide sequences from the genome which encode the individual proteins, but these sequences are not given. A non-human animal infected with RRV can be used for testing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Macaca mulatta rhadinovirus 1757; RRV; rhesus macaque rhadinovirus; genome; Kaposi's sarcoma-associated herpesvirus; KSHV; interleukin 6; IL-6; macrophage inflammatory protein; MIP; diagnosis; vaccine; cytostatic; anti-HIV; gene therapy; infection; Kaposi's sarcoma: lymphoproliferative disorder; B-cell hyperplasia; lymphadenopathy; splenomegaly; hypergammaglobinulinaemia; autoimmune haemolytic anaemia;

the efficacy of drug in the treatment of condition associated with infection with RRV such as Kaposi's sarcoma, lymphoproliferative disorders, B-cell hyperplasia, lymphadenopathy, splenomegaly, hypergammagiobinulinaemia or autoimmune haemolytic anaemia, by administering the drug to a immuno-compromised non-human primate macaque monkey obtained by as a result of infection by Sinian immunodeficiency Virus (SIV). RRV is useful for producing non-human primate model for testing potential treatments for conditions associated with RRV infection. It is also useful for testing the efficacy of the candidate vaccine against RRV infection or conditions associated with its infection by administering the vaccine to the subject capable of infection with RRV, inoculating the subject with RRV and observing the effect of vaccine. AAAG64765 and AAB53205 to AAB53213 represent sequence used in the exemplification of the

    The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 844 sequences set, where (I) comprises a sequence (S) selected from 844 sequences (given in ABLG1664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer.

Cosophageal, ovarian, kidney, prostate or pancreatic cancer.

Cosophageal, ovarian, kidney, prostate or pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in AbiGl664 to ABIG1010), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical curvature and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, cesophageal, ovarian, kidney, prostate or pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Horrigan S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ebner R, Endress G,

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 CC comprises in at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening CC activity and can be used in gene therapy. MI can be used for screening CC anti-neoplastic agent, and can be used for producting a product which is the data collected with respect to the anti-neoplastic agent as a cresult of MI, and the data is sufficient to convey the chemical CC structure and/or properties of the agent. MI can be used in the creatment of cancer such as colon, breast, stomach, lung, thyroid, cosophageal, ovarian, kidney, prostate or pancreatic cancer.

CC infiltrating lobular cancer, squamous cell cancer, infiltrating ductal cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

                                                                                                                                                                                               ó
                                  PCR primers AA226647-48 were used to amplify the antisense cDNA sequence of human tumour rejection antigen RUR-1. The RUR-1 antisense sequence is the antisense strand of a ubiquitoualty expressed gene. The antisense strand codes for a polypeptide which is preferentially expressed in tumour samples and tumour-derived cells lines. The polypeptide is unrelated to any TRAP protein. The sequence was isolated from a renal cell carcinoma line LB9211 RCC. The RUR-1 nucleic acids and polypeptides can be used for diagnosis, prognosis or treatment of a disorder characterized by the expression of a RUR-1 antisense cDNA molecule or an expression product, such as cancers, e.g. renal cell carcinoma, melanoma, sarcoma or leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            complement (1280..1305)

The polynucleotides and polypeptides are useful in gene therapy, vaccines or egitie therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating and activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy; vacchne; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.
The present sequence represents the antisense cDNA sequence of human tumour rejection antisen RUR-1. The present sequence is the antisense strand of a ubiquitously expressed gene. The antisense strand codes for a polypeptide which is preferentially expressed in tumour samples and tumour derived cells lines. The polypeptide is unrelated to any TRAP protein. The sequence was isolated from a renal cell carcinoma line LB9211-RCC. The RUR-1 nucleic acids and polypeptides can be used for diagnosis, prognosis or treatment of a disorder characterized by the expression of a RUR-1 antisense cDNA molecule or an expression product, such as cancers, e.g. renal cell carcinoma, colorectal carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

Antisense compounds of up to 30 nucleobases in length that are capable of inhibiting the expression of PEPCK-cytosolic are provided. The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic are expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

NAME OF THE PROPERTY OF THE PR

```
The present invention describes polynucleotides including biallelic markers derived from genes involved in arachidonic acid metabolism and from genes involved in arachidonic acid metabolism and from genemic regions flanking those genes. Methods from the present invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used in hybridisation assays, sequencing assays and specific amplification assays for identifying an elcosanoid-related biallelic marker (ERBM) or 12-LO-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. AAC57367 to AAC58018 and AAB24019 and AAB24020 represent sequences used in the exemplification of the present invention.

N. B. Polymorphic bases (single nucleotide polymorphisms also known as SNPS) in the polymucleotide sequences from the present invention have been given as their corresponding degenerate bases e.g. a polymorphic base of C or T has been given as Y.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention describes polynucleotides including biallelic markers derived from genes involved in arachidonic acid metabolism and from genomic regions involved in arachidonic acid metabolism and invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used in hybridisation assays, sequencing assays and specific amplification assays for identifying an eicosanoid related biallelic marker (ERBM) or 12-LO-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. AAC57367 to

The present invention describes polynucleotides including biallelic markers derived from genes involved in arachidonic acid metabolism and from genomic regions flanking those genes. Methods from the present invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used in hybridisation assays, sequencing assays and specific amplification assays for identifying an elcosanoid-related biallelic marker (ERBM) or 12-10-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. AAC57367 to AAC58018 and AAB24019 and AAB24019 containing and AAB24019 containing and AAB24019 and AAB24019 and AAB24019 containing and AAB24019 and AAB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; biallelic marker; arachidonic acid metabolism; genotyping; detection; hybridisation; phenotype; haplotype; SNP; polymorphic base; single nucleotide polymorphism; hybridisation assay; sequencing assay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N.B. Polymorphic bases (single nucleotide polymorphisms also known as SNPs) in the polynucleotide sequences from the present invention have been given as their corresponding degenerate bases e.g. a polymorphic base of C or T has been given as Y.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel biallelic markers useful for detecting conditions and genotypes associated with arachidonic acid metabolism ^{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Arachidonic acid metabolism related genomic biallelic marker #634.
Arachidonic acid metabolism related genomic biallelic marker #633.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes polynucleotides including biallelic markers derived from genes involved in arachidonic acid metabolism and from genes involved in arachidonic acid metabolism and from genomic regions flanking those genes. Methods from the present invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used in hybridisation assays, sequencing assays and specific amplification assays for identifying an eicosanoid-related biallelic marker (ERBM) or 12-LO-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. AAC57367 to AAC58018 and AAB24019 and AAB24020 represent sequences used in the exemplification of the present invention.

N.B. Polymorphic bases (single nucleotide polymorphisms also known as SNPs) in the polymucleotide sequences from the present invention have been given as their corresponding degenerate bases e.g. a polymorphic

                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           elcosanoid-related biallelic marker; 12-LO-related biallelic marker; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                    from genomic regions flanking those genes. Methods from the present invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used in hybridisation assays, sequencing assays and specific amplification assays for identifying an eicosanoid-related biallelic marker (ERBM) or 12-LO-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. AAC53367 to AAC58018 and AAB24019 and AAB24020 represent sequences used in the exemplification of the present invention.

S. B. Polymorphic bases (single nucleotide polymorphisms also known as been given as their corresponding degenerate bases e.g. a polymorphic base of C or T has been given as Y.
                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer; cytostatic; carcinogen; pharmacodyanamic marker;

                                                 The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the
                                                                                                                                                                                                                                                                                                  in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cancer; cytostatic; carcinogen; pharmacodyanamic marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                             cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

    is also useful as a pharmacodyanamic or pharmacogenomic marker.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 74.4%; Score 18.6; DB 23; Length 335; 84.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytostatic, immunostimulatory, antimicrobial, antiviral, immunosuppressive, antiinflammatory and vulnerary activity and which act as cytokine, cell proliferation or differentiation regulators. (I) is useful for treating tumors, autoimmune diseases, inflammatory disorders, wounds, microbial infections and viral diseases. (I) is also useful for suppressing graft versus host reaction. AAA40490-A40580 represent cDNA fragments that encode the secreted proteins
                                                                                                                                                                                                                                                            Secreted protein; cytostatic; immunostimulatory; antimicrobial; antiviral; immunosuppressive; antiniflammatory; vulnerary; cytokine; cell proliferation; differentiation; regulator; treatment; tumor; autoimmune disease; inflammatory disorder; wound; microbial infection; viral disease; graft versus host reaction suppression; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Secreted human proteins AS296-11 and AS34-11, useful for treating tumors, autoImmune diseases, inflammatory disorders, wounds, microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel secreted human proteins (I) which have

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system classed neuropathse and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and the suppression activity, arthritis and inflammation, leukaemias and the suppression and constant activity, arthritis and inflammation, leukaemias and the suppression and constant activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification.
